## IN THE CLAIMS:

1. (original) A surgical apparatus for delivering fluid to treat a lesion comprising:

an elongated member having a distal tip and a plurality of openings formed in a sidewall proximal of the distal tip;

a plurality of fluid delivery members movably positioned in the elongated member, each of the fluid delivery members having a lumen and at least one opening communicating with the lumen for delivering fluid to the lesion; and

an actuator operatively associated with the fluid delivery members, the actuator actuable to a first position to move the fluid delivery members from a retracted position within the elongated member to a first deployed position extending radially with respect to the elongated member and actuable to a second position to move the fluid delivery members from the first deployed position to a second deployed position extending further radially from the elongated member, the fluid delivery members being retained in the first and second deployed positions by a retention member

- 2. (original) The apparatus of claim 1, wherein the distal tip of the elongated member is a sharp tip configured to penetrate tissue.
- 3. (original) The apparatus of claim 2, wherein each of the plurality of fluid delivery members has a sharp tip configured to penetrate tissue.
- 4. (original) The apparatus of claim 1, wherein the actuator is axially slidable to move the plurality of fluid delivery members between the retracted, first deployed and second deployed position.
- 5. (original) The apparatus of claim 1, wherein in the first and second deployed positions, a distal end of the fluid delivery member does not extend distally of the distal tip of the elongated member.
- 6. (original) The apparatus of claim 5, wherein the plurality of fluid delivery members are composed of shape memory metal.
- 7. (original) The apparatus of claim 1, wherein one of the plurality of fluid delivery members is extendable to a deployed position in substantial alignment with a longitudinal axis of the elongated member.
- 8. (original) The apparatus of claim 7. wherein the fluid delivery member extendable in substantial alignment with the longitudinal axis has a diameter less than a diameter of the other fluid delivery members which are extendable radially at an angle to the longitudinal axis.
- 9. (original) The apparatus of claim 7. further comprising an elongated guide fixedly mounted within the elongated member, the fluid delivery member extendable in

JP.

()

- 10. (original) The apparatus of claim 1, wherein the retention member comprises a tab engageable in one of a plurality of recesses.
- 11. (original) The apparatus of claim 10, wherein the tab is mounted on the actuator and engages one of a plurality of recesses formed in a housing through which the actuator is slidably received.
- 12. (original) The apparatus of claim 1, further comprising a support tube slidably mounted within the elongated member and operatively connected to the actuator, the plurality of fluid delivery members connected to the support tube.
- 13. (original) The apparatus of claim 1, further comprising a visible indicator to indicate the position of the plurality of fluid delivery members.
- 14. (original) The apparatus of claim 1, wherein the at least one opening in the fluid delivery members is formed in a sidewall of the member and includes multiple openings in the sidewall.

Claims 15-26 (canceled)

27. (original) A surgical apparatus for delivering fluid to treat a lesion comprising:

an elongated member having a sharpened distal tip, a plurality of openings formed in a sidewall proximal of the distal tip, the elongated member having a cross-sectional circumference of between about .18 inches and about .22 inches;

a plurality of hollow fluid delivery members movably positioned in the elongated member, each of the fluid delivery members having a penetrating tip, a lumen and at least one opening communicating with the lumen for delivering fluid to the lesion, each of the fluid delivery members having a cross-sectional circumference of between about .030 inches and about .040 inches; and

an actuator operatively associated with the fluid delivery members, the actuator actuable to a first position to move the plurality of fluid delivery members from a retracted position within the elongated member to a first deployed position extending radially with respect to the elongated member and actuable to a second position to move the plurality of fluid delivery members from the first deployed position to a second deployed position extending further radially from the elongated member.

Claims 28-30 (canceled)
